

Truss Jibs

Truss Jib - Truss jib's can actually be utilized in order to carry, transport and position trusses. The attachment is designed to operate as an extended jib attachment along with a triangular or pyramid shaped frame. Normally, truss jibs are mounted on machinery such as a skid steer loader, a compact telehandler or even a forklift utilizing a quick-coupler accessory.

Older style cranes which have deep triangular truss jibs are usually assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Each bolted or riveted joint is susceptible to rust and thus needs regular maintenance and check up.

Truss jibs are made with a back-to-back collection of lacing members separated by the width of the flange thickness of an additional structural member. This design can cause narrow separation amid the smooth exteriors of the lacings. There is little room and limited access to preserve and clean them against rust. A lot of bolts become loose and corrode inside their bores and should be replaced.
