

Fork Positioner for Forklift

Forklift Fork Positioners - The fork positioner is actually a hydraulic apparatus that could allow the individual driving to be able to operate the forklift without leaving the seat. They are made out of top quality materials and are designed to be able to withstand the most challenging operations and work surroundings. Side shifting units have the extra ability to laterally position the arms or the entire load in order to facilitate much more exact carrying and position in a faster and much more effective way.

The unique blade pocket design could enable the one operating it to be able to securely sway the unit's blades without any worry of damaging the positioning cylinders. This allows the operator the option to either perform independent or simultaneous fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be converted into fork positioners on available units.
