

Used Parts for Forklifts

Used Forklift Parts - Inevitably, forklift components will eventually wear out and require replacing. The option of obtaining new components can become pricey so another idea is to buy used components. This can save much cash eventually. It is a great idea to purchase used lift truck parts that have been remanufactured. These parts would guarantee that you are getting components which would work for a long time and be productive.

Broken or worn parts which are remanufactured are a cheaper solution than rebuilding. With rebuilding components, only the components which are broken or worn out get changed, which means that other wearable parts could break down soon after acquisition.

Remanufacturing however provides the best guarantee for second-hand parts. Reproduced components are taken apart and cleaned and then all wearable pieces are changed. All wearable components are replaced regardless of age or wear which is another rationale why reproduced parts in general work so much better. Any part within the part is new and this provides far longer life to the second-hand part. Depending on the lift truck components which are being redone, the cleaning process and the complete remanufacturing process will vary.

The engines are cleaned after a complete disassembly. Various engine parts like for example spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are pressure washed, disassembled and oven cleaned. A thorough examination is performed in order to check for any cracks. Seals, bearings and bushings are all replaced. Typically, the replacement components utilized on transmission components meet OEM specifications.

Some parts like for example torque converters, the alternator, the water pump, the starter and steer axles can obtain longer serviceability after being remanufactured and having all wearable components replaced. The electronic control in the electric forklift is maintained by the control card. This particular card can even be reproduced with replacing all aged and worn out components. Unlike other forklift components the control card can only have the worn and aged parts replaced.

Remanufactured components are comprehensively inspected upon reassembly to ensure they are in top condition previous to being sold. It is essential when purchasing remanufactured components to be sure they have undergone the proper testing and inspection procedures. On certain bigger parts such as transmissions, steer axles and engines, OEM specification replacement parts should be used.

The lift truck dealer can ensure that the components they have remanufactured meet the OEM specifications. This will even ensure the parts meet industry standards. A lot of details go into remanufacturing used parts. This attention to detail provides more serviceability out of remanufactured components opposed to the components that were only rebuilt.
